# Give every employee an approved way to work with AI.

The company control application for AI coding and agent workflows.

ENVIRONMENT | INTELLIGENCE | CONTROL

THE PROBLEM

# A license does not create a governed workflow.

01 / DATA

## What can leave?

Code, context and retained memory can reach different services.

02 / AUTHORITY

## What can act?

Tools, credentials and agents need explicit limits on actions.

03 / ECONOMICS

## Who owns the result?

Spending, review effort and delivery outcomes need owners.

Company decisions become scattered across clients, gateways, workspaces and conventions.

WHY NOW

# Agents turn suggestions into actions.

| | |
|---|---|
| **Microsoft** | **Permission boundaries need engineering.**<br>Disclosed and patched agent approval and MCP permission flaws. [R1–R2] |
| **Google / DORA** | **Verification remains part of productivity.**<br>Engineer responses describe checking, review and integration work. [R3] |
| **Accenture** | **Scaled adoption is a managed program.**<br>Pilot, controlled comparison and rollout on a managed platform. [R4] |

Sources: R1–R4, appendix • Disclosed flaws ≠ exploited incidents; evidence types and limitations differ

FIRST CUSTOMER

# Start with the platform team.

EMPLOYEE

## Platform engineers and developers

Using company-provided cloud development environments.

CHAMPION

## Head of Platform or Developer Experience

Accountable for the supported path into employee AI work.

BUYING GROUP

## Engineering and security

Jointly evaluate operating value, boundaries and budget.

Initial customer hypothesis: 500–5,000 engineers, existing identity and cloud platform, multiple AI services.

THE CORE PRODUCT

# Publish an approved AI work profile.

| Platform engineering / Read-only investigation | CONCEPT |
| --- | --- |
| **ENVIRONMENT**<br>IDE, runtime and network | **INTELLIGENCE**<br>Models, context and skills |
| **AUTHORITY**<br>Identity, tools and approvals | **OPERATIONS**<br>Checks, limits and evidence |

## Configure once. Publish to the right employees.

An understandable effective configuration for each supported workflow.

EMPLOYEE EXPERIENCE

# From approved access to useful work.

1 / CONFIGURE

## Connect

Identity, services and an environment template.

2 / PUBLISH

## Assign

A reviewed work profile to a group or project.

3 / WORK

## Launch

A supported environment with policy-bound operations.

4 / OPERATE

## Control

Review, resolve exceptions, stop runs and revoke access.

Example: investigate a service issue and propose a code change without production write access.

MOST VALUABLE CONTROL

# Protect the boundary of the work.

BEFORE MODEL DISPATCH

## Control data and destination

Check eligible context and provider; allow, redact, route, block or request review.

BEFORE TOOL EXECUTION

## Bound identity and action

Check resource scope, arguments and approvals; constrain runtime and network.

> Minimized evidence ties the decision to the policy, run and outcome.

COMPANY CHOICE

# Local, cloud or hybrid—by policy.

INTERNAL-ONLY

## Keep eligible work inside

Qualified internal inference and its required internal dependencies.

APPROVED EXTERNAL

## Use permitted providers

Only eligible data, services and destinations under company rules.

HYBRID

## Match the use case

Route and fail over within the same authorization and data boundary.

> Apply the choice to memory, retrieval and inspection—not only the main LLM.

CAPABILITY VISION

# Reusable context needs ownership.

MEMORY / KNOWLEDGE

## Source to lifecycle

Access, scope, provenance, retention and derived-data deletion.

SKILLS / MCP

## Publish reviewed versions

Explicit ownership and permissions for reusable procedures and tools.

DECISION MODELS

## Evaluate specialist signals

Configured classification, routing and escalation functions. Later expansion.

> Model judgment can inform workflow. It cannot grant authority.

CUSTOMER VALUE

# Prove value with the complete task.

| OUTCOME | PILOT MEASURE |
| --- | --- |
| Faster approved access | Time to the first useful employee task |
| Lower platform burden | Setup and exception-handling hours |
| Controlled spending | Full cost per verified outcome, attributed to an owner |
| Reliable delivery | Review effort, rework, defects and stability |

Pass only when useful work improves without unacceptable security, quality or operating regressions.

MARKET HYPOTHESIS

# A focused entry market. A transparent sizing model.

EXAMPLE ACCOUNT VALUE

## $78k

Annual software contract at 200 active users

UNVALIDATED OPPORTUNITY SCENARIOS

| ASSUMED ORGANIZATIONS | AT $78K / YEAR |
|---|---|
| 5,000 | $390m |
| 50,000 | $3.9bn |

10 paid customers would equal **$780k ARR** at this contract value.

COMPETITION

# Close competitors exist. Win on the experience.

| ALTERNATIVE | DOCUMENTED CENTER OF GRAVITY |
|---|---|
| Coder | Development environments, agents and AI governance |
| Agyn | Company console for providers, agents, skills and execution |
| Preloop | Model/tool policies, approvals and run control |
| OpenHands Enterprise | Enterprise software-agent execution |
| Internal assembly | Workspaces, gateway, identity and security tooling |

Our hypothesis: one effective work profile, less integration burden, and a coherent launch-to-revocation workflow.

R6–R9 • Editions differ • Hands-on comparison required • No assertion that competitors cannot provide these outcomes

BUSINESS MODEL

# Subscription software. Customer-controlled services.

PROPOSED ANNUAL PRICING

## $18k + $25 / active user / month

200 users × $25 × 12 + $18k

## $78k ARR

### Paid pilot

**$10k / eight weeks**

Credited toward the first annual agreement upon conversion.

Inference, infrastructure and third-party services paid separately.

GO TO MARKET

# Land with one bounded workflow.

1 / RECRUIT

## Design partners

Target three partners through platform and security relationships.

2 / PILOT

## 20–50 users

One group, one environment/agent combination, defined data paths.

3 / CONVERT

## Annual agreement

Expand after agreed value, security and operating criteria pass.

Expand by engineering group and qualified workload, backed by customer outcome evidence.

EXECUTION PLAN

# Build the core loop before the catalog.

MONTHS 0–3

## Prove the workflow

Confirm buyer and budget; prototype publishing and launch; establish baselines.

MONTHS 4–9

## Qualify the pilot

One environment/agent stack; OIDC, model paths, checks, tools, attribution and revocation.

MONTHS 10–18

## Make it repeatable

Harden operations; qualify another model path; validate memory and support economics.

Later: more adapters, evaluated decision functions and additional employee workflows.

DEFENSIBILITY AND RISK

# Turn integration work into a repeatable product.

OPERATING KNOWLEDGE

## Qualified integrations

Compatibility tests and safe configuration migrations.

TRUSTED WORKFLOWS

## Evaluated behavior

Policy, revocation and acceptance evidence for supported scope.

EMBEDDED OPERATIONS

## Useful administration

Understandable profiles and lifecycle workflows, with portability.

Risks to retire: incumbent convergence, support-heavy integrations, imperfect inspection and uncertain demand.

CURRENT STAGE AND TEAM

# The next proof is customer proof.

DISCOVERY COMPLETE

## Research inputs

Capability inventory, adjacent-product research and company governance evidence.

VALIDATION NEXT

## Customer and product proof

Paying demand, deployment outcomes, tested security and sustainable economics.

**Founding capabilities**

Platform/runtime engineering • Enterprise security and identity
Developer-product design • Technical enterprise sales

# $2.0m

## Fund the proof of a repeatable company rollout.

An illustrative 18-month validation program.

$1.4m product, engineering and security
$0.3m customer development
$0.3m infrastructure, legal and reserve

PROOF POINTS TO REACH

Three completed partner pilots; at least two annual conversions.

Repeatable installation and employee onboarding.

Tested authorization, data paths, revocation and recovery.

Buyer value and sustainable deployment economics.

APPENDIX / ACCEPTANCE

# Company controls need tests, not only settings.

| AREA | PROPOSED ACCEPTANCE EVIDENCE |
| --- | --- |
| Identity / action scope | Cross-user denials; bounded, expiring approvals |
| Data paths | Coverage, bypass tests and scanner failure behavior |
| Context lifecycle | Source access, retention and derived-data deletion |
| Cost / reliability | Run limits, retry caps, cancellation and attribution |
| Operations | Revocation, patching, recovery and private investigation |

A specialist model cannot override a hard deny or supply missing approval.

APPENDIX / PRIMARY SOURCES

# Evidence behind the problem and timing.

**R1** **Microsoft** / Custom-hook approval vulnerability and fix

Disclosure; no exploitation established.

**R2** **Microsoft** / Shared MCP permission grants and fix

Disclosure; no exploitation established.

**R3** **Google / DORA** / Balancing AI tensions: Google engineer responses

Qualitative self-report; not a causal slowdown estimate.

**R4** **GitHub / Accenture** / Pilot, controlled comparison and rollout

Vendor/customer story; no universal uplift inferred.

**R5** **DORA** / AI ROI framework and calculator

Planning model; not realized company savings.

APPENDIX / COMPARISON AND ASSUMPTIONS

# The commercial thesis remains to be validated.

**R6** **Coder** / Released AI governance documentation

Edition and commercial boundaries apply.

**R7** **Agyn** / Company management console

Public documentation; no hands-on comparison performed.

**R8** **Preloop** / Product scope and edition matrix

Features differ by edition.

**R9** **OpenHands** / Enterprise versus open source

Enterprise package distinct from OSS components.

**Assumed:** working brand, ICP, pricing, opportunity scenarios, rollout timing and funding.
**Before circulation:** confirm team, market counts, buyer demand and technical promises.
